

USEFUL TIPS IM12 BULLET ICE MAKER WHT/BLK/SILVER

Model: IM12 BULLET

THANK YOU FOR CHOOSING OUR ICE MAKER

Useful tips

- There are 3 LED light indicators i.e. Ice making, add water and ice full
 - The water level is clearly marked when you lift the plastic ice storage basket
 - Only fill it to that mark and place the storage basket back in position
 - Remove the ice scoop from the basket and place on the space provided on top of the machine
 - You can leave it in but it will simply take up space where there should be ice
 - I added bottled water because tap water is not as pure as bottled water and the machine will therefore not need cleaning all that often
 - By using bottled water, it also eliminates an actual taste of the ice which is quite common when tap water is used (tap water has a bit of a taste as we all know...most people don't like that taste)
 - First load of ice is almost transparent and not solid....sort of like ice flakes
 - After that it makes the correct ice
 - The ice is of a white colour with a nice thick wall
 - The ice looks small at first but it lasts quite a while in the glass when added to liquid
 - When the ice basket is full, the compressor will stop and the ice full light indicator will come on
 - Have a look inside and you will see that the ice piles up on the side (almost looks like a little ice waterfall) and activates the ice full sensor
 - Just scrape it down into the basket and the machine will carry on making ice
 - Keep on doing this and the ice basket will get nice and full instead of only half way
 - Keep it full or store it in the freezer and build up reserves that way
 - When the add water light indicator comes on it is important that you fill to the correct level and then you need to press the start button twice
 - It is because the machine goes on pause when it runs out of water and does not start automatically when you added water to the correct level
 - You can pause the machine at any time by pressing the start button
 - The light will flash when it is on pause
 - When you press it again, the light will be solid and the machine will start working i.e. you will hear the compressor starting
-
